Tutorial: Kustomer Envoy retail example

Last Update: Jun 2026 • Est. Read Time: 4 MIN

To check plan availability, see the pricing page.

Use Copilot with Summaries and custom automations to streamline support workflows in a retail setting. In this tutorial, you'll set up Summaries and build two experts, one for orders and one for refunds, to help your team quickly retrieve information and take action during conversations.

Who can access this feature?	
User types	Admins can access the Reps page.

Prerequisites

Before you start this tutorial, make sure you have the following. These examples ar
specific to the retail use case in this article; your configuration may vary depending
how your Kustomer organization is configured.

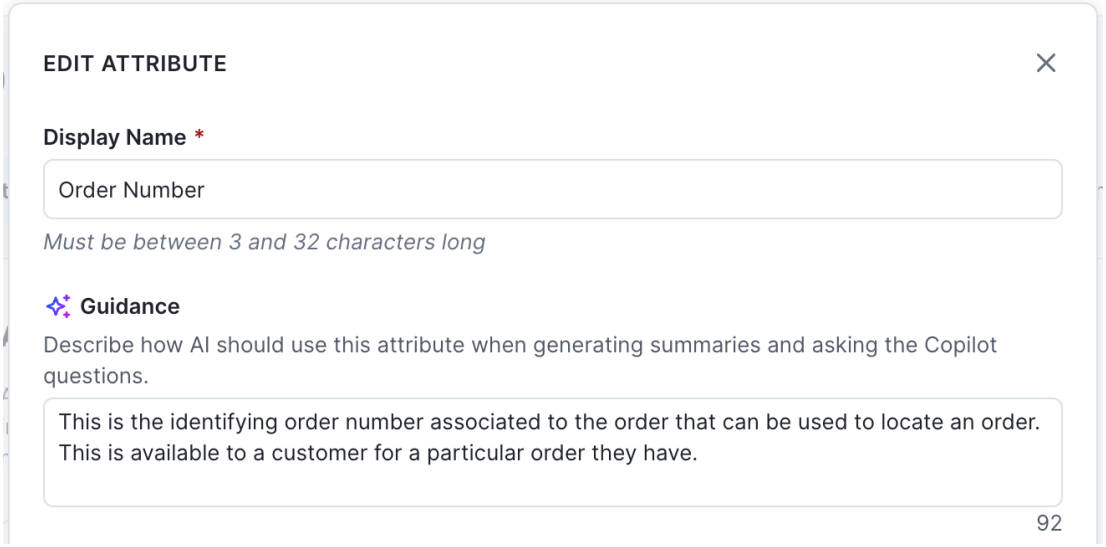

Powered by Kustomer

- Existing attributes for Conversation, Customer, and KOBjects that you want to include in Summaries.
- Two KObjects with at least the following custom attributes
  - **Order:** Order Number and Price
  - **Refunds**: Order Number and Refund Amount
- A knowledge base with articles that pertain to orders and refunds
- An understanding of how to create and configure tools for automations

Set up guidance for your custom attributes

To improve the quality of Summaries, you'll need to provide guidance for each custom attribute. This helps the AI understand what each field means and how it should be referenced when generating summaries.

1. Go to **Settings > Platform > Klasses**, open the **Order** KObject, and add the following guidance to the attributes:
   - **Order Number**: *This is the identifying order number associated with the order that can be used to locate an order. This is available to a customer for a particular order they have.*

   - **Price:** *This represents the cost of the order. This includes tax.*
2. Next, open the **Refunds** KObject and add guidance for the following:
   - **Order Number:** *This is the associated order number that represents the order being refunded.*
   - **Refund Amount:** *This represents the amount of the order price refunded to the customer.*

Set up Summaries

Copilot uses any available AI summaries in the customer's profile to respond to agent questions about the customer or the conversation they are viewing. From the left side navigation, click **Kustomer AI** and then click **Envoy.** Click the **Summaries** tab, and use the toggle to turn on **Summaries** to get started.

1. Select 1-2 existing attributes for the **Conversation** and **Customer** summaries, and 3-4 attributes for the **Handoff** and **Close** summaries that you'd like to include.
2. Next, select **Add KObject summary**, select the **Order** KObject, and select the **Order Number** and **Price** attributes.
3. Select **Add KObject summary** again, select the **Refunds** KObject, and select the **Order Number** and **Refund Amount** attributes.

Set up the default agents in Copilot

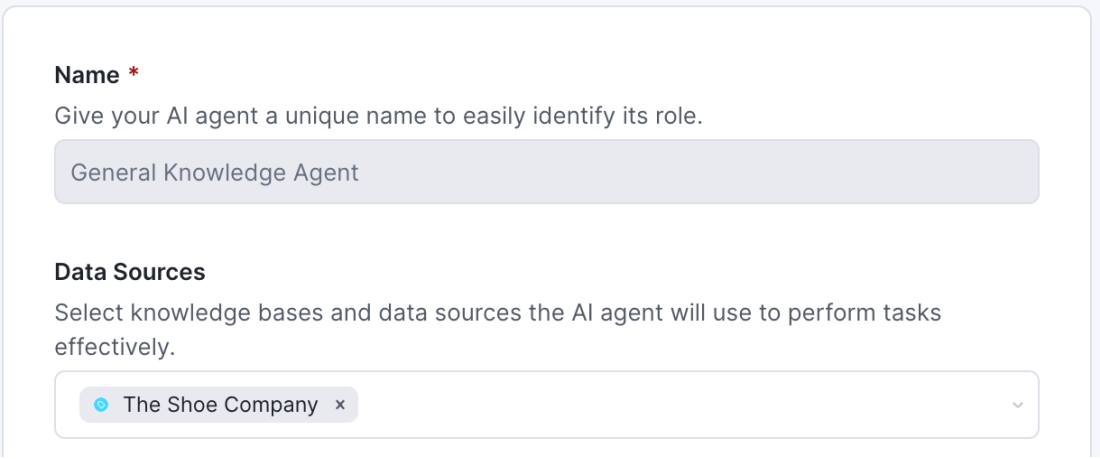

To set up Copilot with Envoy, from the left side navigation, click **Kustomer AI** and then click **Envoy.** Then click the **Copilot** tab.

Copilot includes two core agents by default:

- **Customer Expert Agent -** retrieves and updates specific customer data
- **General Knowledge Agent** - searches your knowledge base and data sources

The **Customer Expert Agent** does not need additional changes from you. However, you can enhance it by adding additional tools, such as a Mark Customer as VIP tool, if needed.

For the **General Knowledge Agent**, select your knowledge base from the available sources. You can choose whether the agent uses internal articles, public articles, or both to generate responses.

Create custom experts

Copilot uses automations to help answer customer questions and carry out tasks, like retrieving detailed order information or creating a return, based on your instructions. For this use case, we recommend creating two specialized agents: an **Order Expert** and **Refund Expert**.

Order Expert

Create an **Order Expert** connected to the Order Klass that uses two tools:

- **SearchOrders** to search for orders on the customer's profile.
- **SearchOrdersByKeyword** to search for an order by keyword, such as an item name.

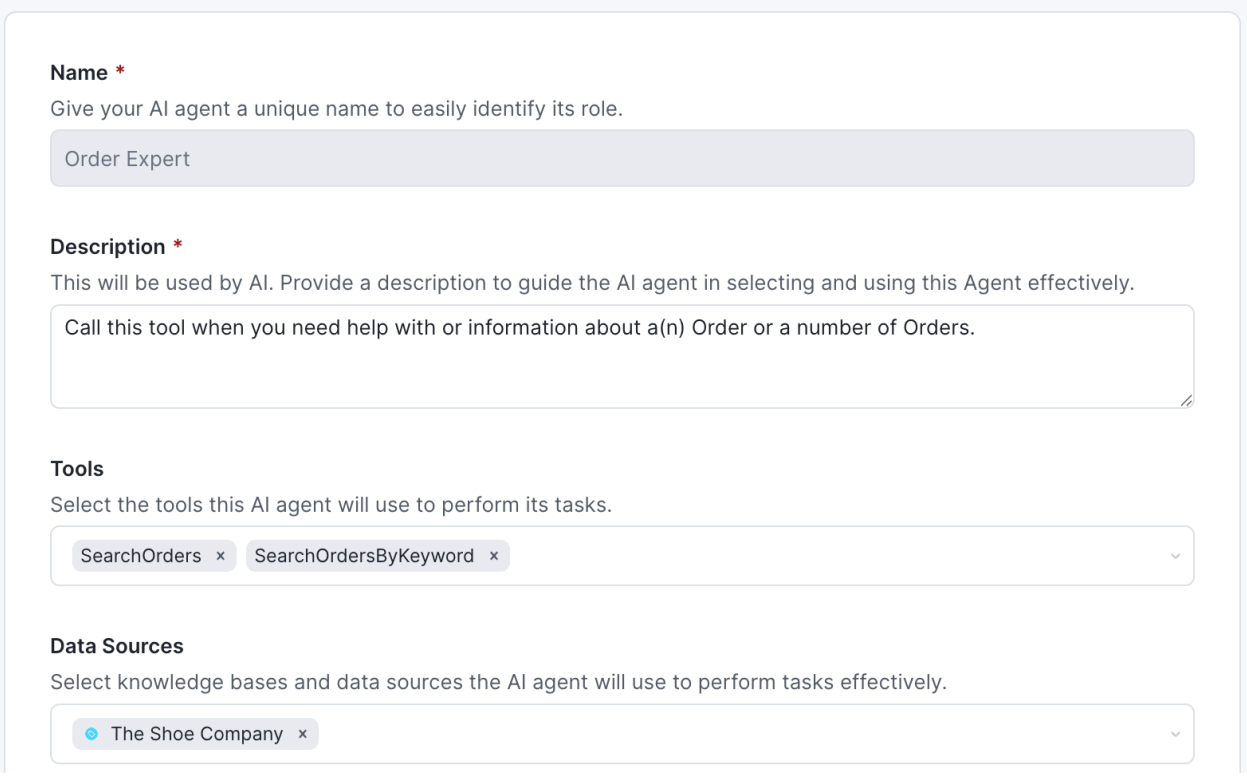

These tools help the expert locate specific orders. You can also optionally add a **Get Orders** tool, which returns up to 25 results.

To configure the **SearchOrders** and **SearchOrdersByKeyword** tools for the Order Expert, use the following setup.

	SearchOrders	**SearchOrdersByKeyword**
Description	Searches for orders using an order number.	Searches for orders by a keyword provided - this could be an item name.
Klass	Order	Order
Operation	Search	Search
Search fields	Order Number	Any Text

Output fields	• CreatedAt • Description • Title • Price	• CreatedAt • Description • Title • Order Number • Price
Search queries	Order Number is equal to AI Reasoning	Any Text is equal to AI Reasoning
Allow automations to reason	✅	✅

Be sure to attach the knowledge base so the expert can reference your order-related policies. Optionally, you can add guidance to give the automation specific instructions, such as how to search for an order.

Refund expert

Create a **Refund Expert** connected to the Refund Klass that uses two tools:

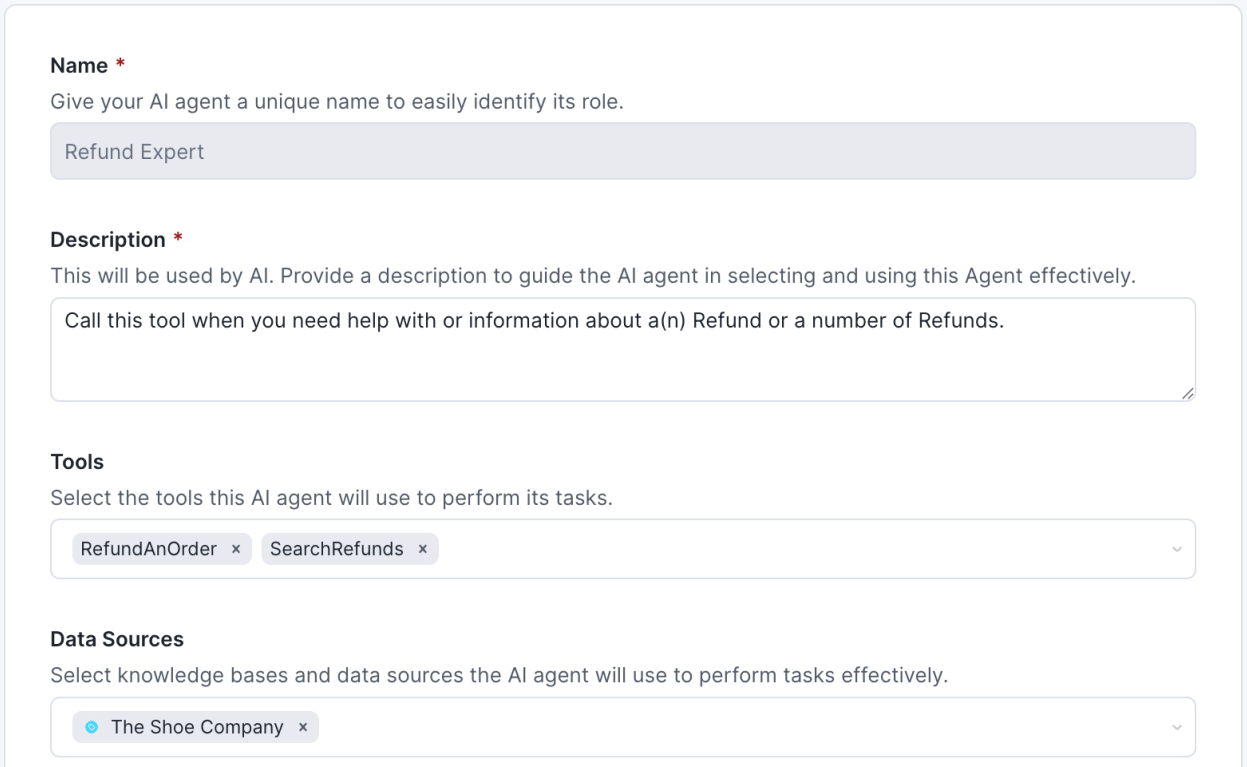

- **RefundAnOrder** to create new refunds
- **SearchRefunds** to search for past refunds

To configure the **RefundAnOrder** and **SearchRefunds** tools for the Refund Expert, use the following setup.

	RefundAnOrder	**SearchRefunds**
Description	This tool will perform the action of refunding an order to a customer.	A tool that will search for refunds associated to an order through the use of an order number, if provided.
Klass	Refund	Refund
Operation	Create	Search
Input fields	• Description • Title • Order Number • Refund Amount	-
Search fields	-	Order Number
Output fields	-	• CreatedAt • Description • Title • Refund Amount
Search queries	-	Order Number is equal to AI Reasoning
Allow AI Agents to reason	-	✅

Be sure to attach the knowledge base so the expert can reference your order-related refund policies. Optionally, you can add guidance to give the automation specific

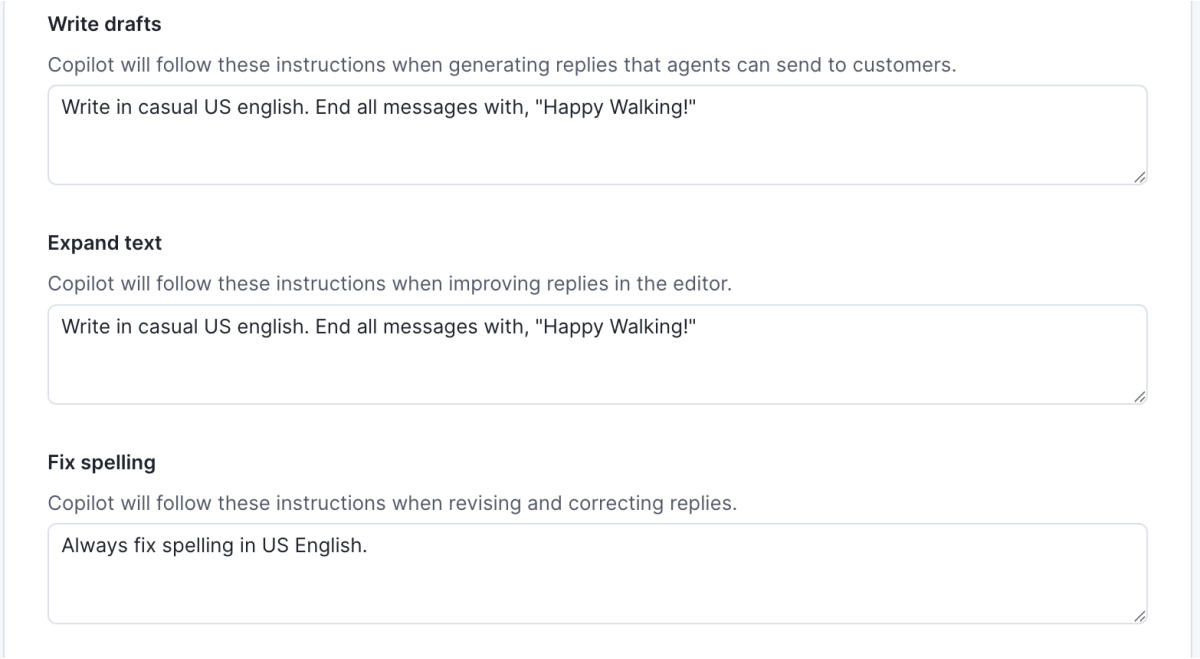

refund policies. Optionally, you can add guidance to give the automation specific instructions, such as how to create a refund.

Set up Copilot writing guidance

You can give Copilot instructions on how to suggest messages and expand or fix agent replies. You can use the following guidance for this tutorial:

- **Write drafts:** Write in casual US English. End all messages with "Happy Walking!"
- **Expand text:** Write in casual US English. End all messages with "Happy Walking!"
- **Fix spelling:** Always fix spelling in US English.

Turn on Copilot

Once everything is configured, go to the **Copilot** settings page and use the toggle to turn it on. By default, all teams in your organization will have access to Copilot. To limit access, select specific teams from the drop-down menu.
