

GraphQL Queries Rewrite brief

This brief outlines the task and requirements for updating the [GraphQL Queries](#) page. Queries and mutations are now two separate pages, these changes apply only to Queries.

Target Audience

As a software developer, I'm looking to understand basic instruction and use cases for queries.

Key User Goals

- Use queries to fetch data from a GraphQL Server.
- Understand key terms related to queries.
- Understand use cases and basic examples that illustrate functionality and explain syntax.

Structure/Information Architecture Changes

- In the intro, add a table that lists the components of a query: **Fields**, **Arguments**, **Aliases**, **Variables**, **Fragments**, and **Directives**, with a brief definition of each to give the user more context. (*Consult with **engineering SME** on definitions*)
- Restructure so **Operation type and name** are section 1, followed by **Fields**, **Arguments**, **Aliases**, **Variables**, **Fragments**, then **Directives**. (*Consult with **UX/Design** and **Product** on user logic*)
 - In **Variables**, change the order of H3 subheads to "Default variables" then "Variables definitions".
 - In **Variable definitions**, move paragraph 4 to paragraph 2, then add these H3 subheads for scannability:
 - **Variable input types** – includes the current paragraph 2 "All declared variables must be either Scalar...".
 - **Optional and required variables** – includes the current paragraph 3 "Variable definitions can be optional or required...".

Milestones

- Kickoff and scoping with PM, Engineering SME, and UX/Design.
- Article restructure with rewrites.
- Feedback and draft approval from key stakeholders.
- Code pass and technical review (*Writer to test, engineering to proof*)

Open Questions

- In **Using variables inside fragments**, cell 3 is empty. Is this cell still needed here?

GraphQL Mutations Rewrite brief

This brief outlines the task and requirements for updating the [GraphQL Mutations](#) page. Queries and mutations are now two separate pages, these changes apply only to Mutations.

Target Audience

As a software developer, I'm looking to understand basic instruction and use cases for mutations

Key User Goals

- Use mutations to modify data with GraphQL.
- Understand use cases and basic examples that illustrate functionality and explain syntax.

Structure/Information Architecture Changes

- Restructure page to follow some logic to how users handle data: **Add new data**, **Update existing data**, **Remove existing data**, **Multiple fields in mutations**, **Purpose-built mutations**. (*Check with **Product** and **engineering** on alignment here*)
 - In **Add new data**, include these subheads for scannability:
 - “Mutation arguments”, which includes the existing section on **ReviewInput**.
 - “Sample function: Create a review” which includes the existing sample function to avoid orphaned header style violation.
 - In the three-cell table of **Add new data**, rename “Variables” to “**Episode** and **Review** Variables” for clarity.
 - In the three-cell table of **Update existing data**, rename “Variables” to “**ID** and **Name** variables”
- Check with **UX and/or Design** (*and possibly **engineering SME***) on if coded examples still match modern user intent and logic.
- Cut sentences 1 and 2 of paragraph 1 of **Purpose-built mutations**.

Milestones

- Kickoff and scoping with PM, Engineering SME, and UX/Design.
- Article restructure with rewrites.
- Feedback and draft approval from key stakeholders.
- Code pass and technical review (*Writer to test, engineering to proof*)

Open Questions

> All of the features of GraphQL operations that apply to queries also apply to mutations, so review the [Queries](#) page first before proceeding.

This note exists in mutations. It should probably also exist on Queries and point back to mutations.

> All of the features of GraphQL operations that apply to mutations also apply to queries, so review the [Mutations](#) page first before proceeding.
